

Re-Useable Components

It is always good practice to keep used components aside, until the job at hand has been completed. This not only assists in part recognition and fault diagnosis it will also prevent re-useable components being disposed by mistake.

Today we are finding an increasing number of engines are being manufactured with re-useable camshaft plugs or half moon seals. Often these items are manufactured from steel, aluminium or hard plastics. Care should be taken to ensure that these components are not thrown out as they may not be included in gasket sets, and in some cases are not available as an aftermarket or genuine replacement part.
